

SD-card deck

SKU: 114990852

Add the possibility to read and write files to a micro SD card. This could be used for high speed logging or for storing configuration.

1. Features

- Automatic detection of deck via 1-wire memory
- Micro SD card reader
- Support for FAT file system in the Crazyflie 2.X firmware

2. Electrical specifications

It's possible to switch the pin used for SPI chip select using the solder bridges on the bottom of the board. By default GS4 is used (IO4), but this line can be cut and another bridge soldered to select another IO (IO1-3) for chip select.

3. Mechanical specifications

- Weight: 1.7g
- Size (WxHxD): 21x28x4mm
- Designed for mounting above or under the Crazyflie 2.X

4. Mechanical drawing

5. Package contents

- 1 x SD-card deck

6. Errata

6.1. SPI bus limitations

The SD-Card is using the SPI bus on the deck port to communicate. This has turned out to have some implications for the other decks that use the SPI bus. The effected decks are the *Loco positioning deck* and the *Flow v1/v2 deck*. An issue has been open about it and currently we have no easy solution. One workaround is to use a “hidden” SPI on the deck port that is multiplexed with TX1, RX1 and IO_4. This SPI port is called SPI3 in the STM32F405 and after this commit there is a possibility to switch to this SPI bus.

The following steps can he used to work around this issue:

- First thing the SD-card deck needs to be patched. This is a quite hard to cut the small lines and solder small patch wires. Easier is to use a sd-card breakout deck such as this and solder wires to e.g. the battery holder board.
 - CS→RX2(PA3)
 - SCLK→TX1(PC10)
 - MISO→RX1(PC11)
 - MOSI→IO_4(PC12)
- Compile the firmware with `CFLAGS += -DUSDDECK_USE_ALT_PINS_AND_SPI` in your config.mk file.
- If you want to use the Loco-deck at the same time, the alternative pins for this must be used. This means cutting GS1 and GS2 underneath the Loco positioning deck and soldering the bridged GS3 and GS4. Then add `CFLAGS += -DLOCODECK_USE_ALT_PINS` to you `config.mk` as well.
